## European Technical Assessment ETA-19/0020 of 2020/07/06

### General Part

#### Technical Assessment Body issuing the ETA and designated according to Article 29 of the Regulation (EU) No 305/2011: ETA-Danmark A/S

Trade name of the  
construction product:

Eurotec Hold Downs

Product family to which the  
above construction product  
belongs:

Three-dimensional nailing plate (hold-downs for timber-  
to-timber or timber-to-concrete or steel connections)

Manufacturer:

E.u.r.o. Tec GmbH  
Unter dem Hofe 5  
D-58099 Hagen  
Tel. +49 2331 / 6245 - 0  
Fax +49 2331 / 6245 - 200  
Internet [www.e-u-r-o-tec.de](http://www.e-u-r-o-tec.de)

Manufacturing plant:

HSW 34, HSW 43, HSW 44

This European Technical  
Assessment contains:

27 pages including 2 annexes which form an integral  
part of the document

This European Technical  
Assessment is issued in  
accordance with Regulation  
(EU) No 305/2011, on the  
basis of:

Guideline for European Technical Approval (ETAG) No.  
015 Three Dimensional Nailing Plates, April 2013, used  
as European Assessment Document (EAD).

This version replaces:

With the same number issued on 2020-04-14

Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and should be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full (excepted the confidential Annex(es) referred to above). However, partial reproduction may be made, with the written consent of the issuing Technical Assessment Body. Any partial reproduction has to be identified as such.

## II SPECIFIC PART OF THE EUROPEAN TECHNICAL ASSESSMENT

### 1 Technical description of product and intended use

#### Technical description of the product

E.u.r.o. Tec hold-downs are one-piece welded or similarly joined face-fixed nailing plates to be used in timber to concrete or to steel or in timber to timber connections.

E.u.r.o. Tec angle brackets, shear angles, shear plates, tensile strips and lifting anchors are one-piece non-welded, face-fixed nailing plates to be used in timber to timber or in timber to concrete or to steel connections. They are connected to construction members made of timber or wood-based products with profiled (ringed shank) nails according to EN 14592 or ETA or screws according to ETA-11/0024 and to concrete or steel members with bolts or metal anchors.

The angle brackets with a steel plate thickness of 3 mm are made from the following materials:

- Hold downs from pre-galvanized steel S355 Fe Zn 12c according to EN 10025:2004
- Shear angles H-H and H-B from pre-galvanized steel S235 Fe Zn 12c according to EN 10025-2:2004
- Angle brackets, shear plates and tensile strips from pre-galvanized steel S250GD / Z275 according to EN 10346:2015
- Base plates from pre-galvanized steel S235 Fe Zn 12c according to EN 10025:2004
- Lifting anchors from steel S235JR according to EN 10025-2:2004

Dimensions, hole positions and typical installations are shown in Annex B. E.u.r.o. Tec hold-downs, angle brackets, shear plates and tensile strips are made from steel with tolerances according to EN 10143.

### 2 Specification of the intended use in accordance with the applicable EAD

The hold-downs, angle brackets, shear angles, shear plates, tensile strips and lifting anchors are intended for use in making connections in load bearing timber structures, as a connection between a beam and a purlin, where requirements for mechanical resistance and stability and safety in use in the sense of the Basic Works Requirements 1 and 4 of Regulation (EU) 305/2011 shall be fulfilled.

The connection may be with a single nailing plate or with nailing plates on one or both sides of the fastened timber member (see Annex B).

The static and kinematical behaviour of the timber members or the supports shall be as described in Annex A and B.

The wood members may be of solid timber, glued laminated timber and similar glued members, or wood-based structural members with a characteristic density from 290 kg/m<sup>3</sup> to 460 kg/m<sup>3</sup>. This requirement to the material of the wood members can be fulfilled by using the following materials:

- Structural solid timber according to EN 14081,
- Glulam according to EN 14080,
- Glued solid timber according to EN 14080,
- LVL according to EN 14374,
- Cross laminated timber according to ETA.

Annex B states the load-carrying capacities of the connections for a characteristic density of 350 kg/m<sup>3</sup>. For timber or wood based material with a lower or higher characteristic density than 350 kg/m<sup>3</sup> the load-carrying capacities shall be reduced or may be increased by the factor  $k_{dens}$ :

$$k_{dens} = \left( \frac{\rho_k}{350} \right)^{0.5}$$

where  $\rho_k$  is the characteristic density of the timber in kg/m<sup>3</sup>.

If a wood-based panel interlayer with a thickness of not more than 26 mm is placed between the connector plate and the timber member, the lateral load-carrying capacity of the nail or screw, respectively, has to take into account the effect of the interlayer.

The design of the connections shall be in accordance with Eurocode 5 or a similar national Timber Code. The wood members shall have a thickness which is larger than the penetration depth of the nails or screws into the members.

The nailing plates are primarily for use in timber structures subject to the dry, internal conditions defined by service classes 1 and 2 of Eurocode 5 and for connections subject to static or quasi-static loading.

The nailing plates can also be used in outdoor timber structures, service class 3, when a corrosion protection in accordance with Eurocode 5 is applied, or when stainless steel with similar or better characteristic yield strength and ultimate strength is employed.

The scope of the connectors regarding resistance to corrosion shall be defined according to national provisions that apply at the installation site considering environmental conditions and in conjunction with the admissible service conditions according to EN 1995-1-1

and the admissible corrosivity category as described and defined in EN ISO 12944-2.

The hold-downs, angle brackets, shear angles, shear plates, tensile strips and lifting anchors may also be used for connections between a timber member and a member of concrete or steel.

**Assumed working life**

The assumed intended working life of the connectors for the intended use is 50 years, provided that they are subject to appropriate use and maintenance.

The information on the working life should not be regarded as a guarantee provided by the manufacturer or ETA Danmark. An “assumed intended working life” means that it is expected that, when this working life has elapsed, the real working life may be, in normal use conditions, considerably longer without major degradation affecting the essential requirements.

### 3 Performance of the product and references to the methods used for its assessment

Characteristic	Assessment of characteristic
<b>3.1 Mechanical resistance and stability (BWR 1)*</b>	
Characteristic load-carrying capacity	See Annex B
Stiffness	See Annex B
Ductility in cyclic testing	No performance assessed
<b>3.2 Safety in case of fire (BWR 2)</b>	
Reaction to fire	The connectors are made from steel classified as <b>Euroclass A1</b> in accordance with EN 13501-1 and Commission Delegated Regulation 2016/364
<b>3.3 Hygiene, health and the environment (BWR 3)</b>	
No performance assessed	
<b>3.7 Sustainable use of natural resources (BWR 7)</b>	
No performance assessed	
<b>3.8 General aspects related to the performance of the product</b>	
The hold downs have been assessed as having satisfactory durability and serviceability when used in timber structures using the timber species described in Eurocode 5 and subject to the conditions defined by service classes 1 and 2	

\*) See additional information in section 3.9 – 3.12.

### 3.9 Methods of verification

#### Safety principles and partial factors

The characteristic load-carrying capacities are based on the characteristic values of the nailed or screwed connections and the steel plates. To obtain design values the capacities have to be divided by different partial factors for the material properties, the nailed or screwed connection in addition multiplied with the coefficient  $k_{mod}$ .

According to EN 1990 (Eurocode – Basis of design) paragraph 6.3.5 the design value of load-carrying capacity may be determined by reducing the characteristic values of the load-carrying capacity with different partial factors.

Thus, the characteristic values of the load-carrying capacity are determined also for timber failure  $F_{Rk,H}$  (obtaining the embedment strength of fasteners subjected to shear or the withdrawal capacity of the most loaded fastener, respectively) as well as for steel plate failure  $F_{Rk,S}$ . The design value of the load-carrying capacity is the smaller value of both load-carrying capacities.:

$$F_{Rd} = \min \left\{ \frac{k_{mod} \cdot F_{Rk,T}}{\gamma_{M,T}}; \frac{F_{Rk,S}}{\gamma_{Mi,S}} \right\}$$

Therefore, for timber failure or failure of the metal fasteners the load duration class and the service class are included. The different partial factors  $\gamma_M$  for steel or timber failure, respectively, are also correctly taken into account.

#### 3.10 Mechanical resistance and stability

See annex B for the characteristic load-carrying capacity in the different directions  $F_1$ ,  $F_2$ ,  $F_3$  and  $F_4$

The characteristic capacities of the connectors are determined by calculation assisted by testing as described in the EOTA Guideline 015 clause 2.4.1. They should be used for designs in accordance with Eurocode 5 or a similar national Timber Code.

No performance has been determined in relation to ductility of a joint under cyclic testing. The contribution to the performance of structures in seismic zones, therefore, has not been assessed.

No performance has been determined in relation to the joint's stiffness properties - to be used for the analysis of the serviceability limit state.

### 3.11 Aspects related to the performance of the product

In accordance with ETAG 015 the hold downs are produced from the following materials:

- Hold downs from pre-galvanized steel S355 Fe Zn 12c according to EN 10025:2004
- Angle brackets, shear plates and tensile strips from pre-galvanized steel S250GD / Z275 according to EN 10346:2015
- Base plates from pre-galvanized steel S235 Fe Zn 12c according to EN 10025:2004

### 3.12 General aspects related to the use of the product

The performance given in this ETA are based on the following:

- The structural members – the components 1 and 2 shown in the figure on page 12 – to which the brackets are fixed shall be:
  - Restrained against rotation.
  - Strength class C14 or better, see section 3 of this evaluation report
  - Free from wane under the bracket.
- The actual end bearing capacity of the timber member to be used in conjunction with the bracket is checked by the designer of the structure to ensure it is not less than the bracket capacity and, if necessary, the bracket capacity reduced accordingly.
- The gap between the timber members does not exceed 3 mm.
- There are no specific requirements relating to preparation of the timber members.

## **4 Assessment and verification of constancy of performance (AVCP)**

### **4.1 AVCP system**

According to the decision 97/638/EC of the European Commission<sup>1</sup>, as amended, the system(s) of assessment and verification of constancy of performance (see Annex V to Regulation (EU) No 305/2011) is 2+.

## **5 Technical details necessary for the implementation of the AVCP system, as foreseen in the applicable EAD**

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited at ETA-Danmark prior to CE marking.

Issued in Copenhagen on 2020-07-06 by

Thomas Bruun  
Managing Director, ETA-Danmark

**Annex A**

Table A.3 Fastener specification

Fastener	Length	Profiled Length	Fastener type
Nail 4.0 mm	40 mm	25 mm	Ringed shank nails according to EN 14592
	50 mm	35 mm	
	60 mm	45 mm	
E.u.r.o. Tec WBS screw 5.0 mm	25 mm	16 mm	Self-tapping screws according to ETA-11/0024
	40 mm	31 mm	
	50 mm	41 mm	
	60 mm	51 mm	
E.u.r.o. Tec Paneltwistec screw 5.0 mm	120 mm	70 mm	
E.u.r.o. Tec KonstruX screw 10.0 mm	125 mm	116 mm	Self-tapping screws according to ETA-11/0024
E.u.r.o. Tec VSS screw 6.0 mm	60 mm	50 mm	Self-tapping screws according to ETA-11/0024

In the load-carrying-capacities of the nailed or screwed connection in Annex B the capacities calculated from the formulas of Eurocode 5 are used assuming a thick steel plate when calculating the lateral fastener load-carrying-capacity. The characteristic withdrawal capacity of the nails or screws is determined by calculation in accordance with EN 1995-1-1:2010, paragraph 8.3.2 (head pull-through is not relevant):

$$F_{ax,Rk} = f_{ax,k} \cdot d \cdot t_{pen} \quad \text{for the nails 4.0 mm}$$

$$F_{ax,Rk} = k_{ax} \cdot f_{ax,k} \cdot d \cdot \ell_{ef} \left( \frac{\rho_k}{\rho_a} \right)^{0,8} \quad \text{for the screws 5.0 mm}$$

where:

$k_{ax}$  Factor taking into account the angle between screw axis and grain direction;  $k_{ax} = 1$  for  $\alpha \leq 45^\circ$

$f_{ax,k}$  Characteristic value of the withdrawal parameter in  $N/mm^2$

$d$  Nail or screw diameter in mm

$t_{pen}$  Penetration depth of the profiled shank in mm

$\rho_k$  Characteristic density of the timber in  $kg/m^3$

$\rho_a$  Characteristic density of the timber in  $kg/m^3$  according to  $f_{ax,k}$

Based on tests by Versuchsanstalt für Stahl, Holz und Steine, Karlsruhe Institute of Technology, the characteristic value of the withdrawal resistance for the threaded nails used may be assumed as:

$$f_{ax,k} = 6,125 N/mm^2 \text{ for } \rho_k = 350 kg/m^3$$

Based on ETA-11/0024 the characteristic value of the withdrawal resistance and the characteristic value of fastener's yield moment for E.u.r.o. Tec screws  $d = 5.0$  mm is:

$$f_{ax,k} = 12,1 N/mm^2$$

$$M_{y,k} = 5910 Nmm$$

The shape of the nail or screw directly under the head shall be in the form of a truncated cone with a diameter under the head which fits or exceeds the hole diameter.

Bolt diameter	Correspondent hole diameter	Bolts type
12.0 to 28.0 mm	Max. 2 mm larger than the bolt diameter	See specification of the manufacturer

Metal Anchor diameter	Correspondent Hole diameter	Anchors type
12.0 to 28.0 mm	Max. 2 mm larger than the anchor diameter	See specification of the manufacturer

**Annex B**  
**Characteristic load-carrying capacities**

**Table 1:**  $F_{t,Rk}$  per nailing plate with washer or base plate / connection timber to timber or timber to concrete or steel

Type	Timber $\rho_k = 350 \text{ kg/m}^3$						steel	bolt	concrete
	capacity per fastener in the vertical flange $F_{v,Rk}$ [kN]						$F_{t,Rk}$ [kN]	$k_{t,II}$	$\ell_D$ [mm]
	Nails			Screws					
	4x40	4x50	4x60	5x40	5x50	5x60			
Hold-down 340 or 440 + washer 30x3 or base plate	1,56	1,84	1,90	2,14	2,28	2,43	57,1	1,4	10
Hold-down HighLoad + base plate HL	1,56	1,84	1,90	2,14	2,28	2,43	See equation (B.1)	1,4	10
Shear angle 230x120 + base plate 230	1,56	1,84	1,90	2,14	2,28	2,43	116	1,7	10
	capacity per shear angle $F_{1,Rk}$ [kN]						$F_{t,Rk}$ [kN]	$k_{t,II}$	$\ell_D$ [mm]
Shear angle 230x100* + base plate 230 + 2 bolts M12 close to bend line	30,0						120	2,0	10
* 6 screws 5x120 and 3 screws 5x25 per flap									

Characteristic load-carrying capacity  $F_{t,Rk}$  for Hold-down HighLoad:

$$F_{t,Rk} = \min \left\{ A \cdot f_{y,k}; 0,9 \cdot A_{net} \cdot f_{u,k} \right\} \quad (\text{B.1})$$

Where:

- A** Cross-section area of the vertical flap in  $\text{mm}^2$   
 $A = 210 \cdot (1 + h_f/600)$  in  $\text{mm}^2$
- $h_f$**  Distance of the lowermost nail or screw from the upper end of the vertical flap in mm
- $f_{y,k}$**  Characteristic yield strength of vertical flap in  $\text{N/mm}^2$ ,  $f_{y,k} = 355 \text{ MPa}$
- $f_{u,k}$**  Characteristic ultimate strength of vertical flap in  $\text{N/mm}^2$ ,  $f_{u,k} = 510 \text{ MPa}$
- $A_{net}$**  Net cross-section area of the vertical flap in  $\text{mm}^2$   
 $A_{net} = 210 \cdot (1 + h_f/600) - n_h \cdot 15$  in  $\text{mm}^2$
- $n_h$**  Number of nail or screw holes in the cross-section at the lowermost fastener

**Table 2:**  $F_{t,Rk}$  per nailing plate / timber to timber connection

Type	Timber $\rho_k = 350 \text{ kg/m}^3$

	Partial 1	34	6	23,9	28,1	29,1	32,7	34,9	37,2
	Partial 2	29	4	19,3	22,8	23,6	26,5	28,3	30,1
Shear plate 240x230	Full	41	6	30,5	36,0	37,2	41,9	44,6	47,6
	Partial 1	34	6	23,9	28,1	29,1	32,7	34,9	37,2
	Partial 2	29	4	19,3	22,8	23,6	26,5	28,3	30,1

**$F_{23,Rk}$  per shear angle 230x100 with full screw pattern / timber-timber connection,**  
 $\rho_k = 350 \text{ kg/m}^3$  (6 screws 5x120 and 3 screws 5x25 per flap and 5 screws 10x125 per angle):

$$F_{23,Rk} = 40 \text{ kN}$$

**$F_{23,Rk}$  per shear angle 230x100 with full screw pattern\* / timber-to-concrete or steel connection,**  
 $\rho_k = 350 \text{ kg/m}^3$  (6 screws 5x120 and 3 screws 5x25 per vertical flap):

$$F_{23,Rk} = \min \{40 \text{ kN}; n_{ef} \cdot F_{v,bolt,Rk}\}$$

Where  $n_{ef} = 1,89$  for two bolts close to bend line,  $n_{ef} = 1,48$  for two bolts away from bend line

**$F_{4,Rk}$  per shear angle 230x100 with full screw pattern / timber-timber connection,**  
 $\rho_k = 350 \text{ kg/m}^3$  (6 screws 5x120 and 3 screws 5x25 per flap and 5 screws 10x125 per angle):

$$F_{4,Rk} = 40 \text{ kN}$$

**$F_{4,Rk}$  per shear angle 230x100 with full screw pattern\* / timber-to-concrete or steel connection,**  
 $\rho_k = 350 \text{ kg/m}^3$  (6 screws 5x120 and 3 screws 5x25 per vertical flap):

$$F_{4,Rk} = \min \{40 \text{ kN}; n_B \cdot F_{v,bolt,Rk}\}$$

**$F_{ax,Rk}$  per lifting anchor 40x80 parallel to anchor axis with full screw pattern,**  
(8 VSS screws 6x60):

$$F_{ax,Rk} = 0,218 \cdot \rho_k^{0,8} \text{ kN}$$

for CLT members and glulam members loaded perpendicular to member plane or parallel to grain,

$$F_{ax,Rk} = \min \left\{ 0,218 \cdot \rho_k^{0,8}; \frac{0,5 \cdot h}{h - 60} \left( 0,0065 + \frac{64,8}{h^2} \right) \cdot (100 \cdot h)^{0,8} \right\} \text{ kN}$$

for glulam members loaded in plane perpendicular to grain,

**$F_{v,Rk}$  per lifting anchor 40x80 perpendicular to anchor axis with full screw pattern,**  
load eccentricity  $e = 38 \text{ mm}$  to member surface, (8 VSS screws 6x60):

$$F_{v,Rk} = \frac{0,057 \cdot \rho_k}{\max \{1,95 \cdot \sin^2 \alpha + \cos^2 \alpha; 2,5 \cdot \cos^2 \varepsilon + \sin^2 \varepsilon\}} \text{ kN}$$

Where

- $\alpha$  Angle between load and grain direction;  
for anchors in wide surface of CLT:  $\alpha =$  angle between load and grain direction of outer layer,  
for anchors in edge or end grain surface of CLT loaded in plane:  $\alpha = 0^\circ$ ,  
for anchors in edge or end grain surface of CLT loaded perpendicular to member plane:  $\alpha = 90^\circ$ ,

- $\varepsilon$  Angle between anchor axis and grain direction;  
for anchors in CLT:  $\varepsilon = 90^\circ$ ,
- $h$  Glulam member depth in mm.

### Slip moduli

The slip modulus per shear angle 230x100 may be assumed as:

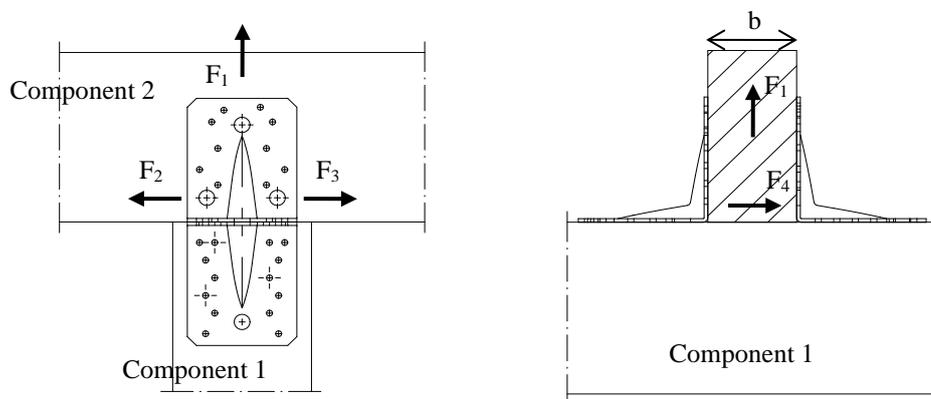

$$K_{1,ser} = 5 \text{ kN/mm}$$

$$K_{23,ser} = 15 \text{ kN/mm}$$

$$K_{4,ser} = 10 \text{ kN/mm}$$

### Definitions of forces, their directions and eccentricity

#### Forces - Beam to beam connection

#### Fastener specification

Holes are marked referring to the fastener pattern.

#### Double angle brackets per connection

The angle brackets must be placed at each side opposite to each other, symmetrically to the component axis.

Acting forces

$F_1$  Lifting force acting along the central axis of the joint.

$F_2$  and  $F_3$  Lateral force acting in the joint between the component 2 and component 1 in the component 2 direction

#### Single angle bracket per connection

Acting forces

$F_1$  Lifting force acting in the central axis of the angle bracket. The component 2 shall be prevented from rotation.

$F_2$  and  $F_3$  Lateral force acting in the joint between the component 2 and the component 1 in the component 2 direction. The component 2 shall be prevented from rotation.

$F_4$  Lateral force acting perpendicular to the central axis of the joint towards a shear angle.

#### Wane

Wane is not allowed; the timber has to be sharp-edged in the area of the angle brackets.

#### Timber splitting

For the lifting force  $F_1$  it must be checked in accordance with Eurocode 5 or a similar national Timber Code that splitting will not occur.
